Android App Development – Practical Task 1

- As for practicing what we learned so far please create the new project called BMICalculator
- Create the following UI
- 
- And implement the functionality of calculating the BodyMassIndex value (and the "diagnosis") based on the input values provided by the user according to
    - the following formula.

$$BMI = \frac{\text{Weight in kilogram}}{\left(\text{Height in meter}\right)^2}$$

    -
    - And the following rules for diagnosis:
        - BMI < 18.5 -> Underweight
        - BMI in the range of 18.5 – 24.9 -> Healthy

    - BMI in the range of 25 – 29.9 -> Overweight
    - BMI in the range of 30 – 34.9 -> Obesity

- The application should be (reasonably ☺) resilient to erroneous input like no data provided, division by zero etc.
- You may start with presenting the “diagnosis” like the coloured textual information but we should present it as a 'pictorial' information. For this purposes feel free to use a publicly available graphics you find as a relevant ones
- When done, please upload to the UPEL short video cast presenting the code and how your app is working. Thank you.
